

Auction to Store EDI Flow

EDI 204:

Carmax sends individual load tender for each vehicle (car) move. Information such as Move ID, locations etc., should be saved to send on EDI 211

EDI 211 from Carrier to OTM:

Multiple load tenders should be combined based on how the truck is being built with multiple vehicles (cars). Multiple Move Ids should be sent on a combined 211. Location information should match with OTM Location information.

EDI 211 from OTM to Carrier:

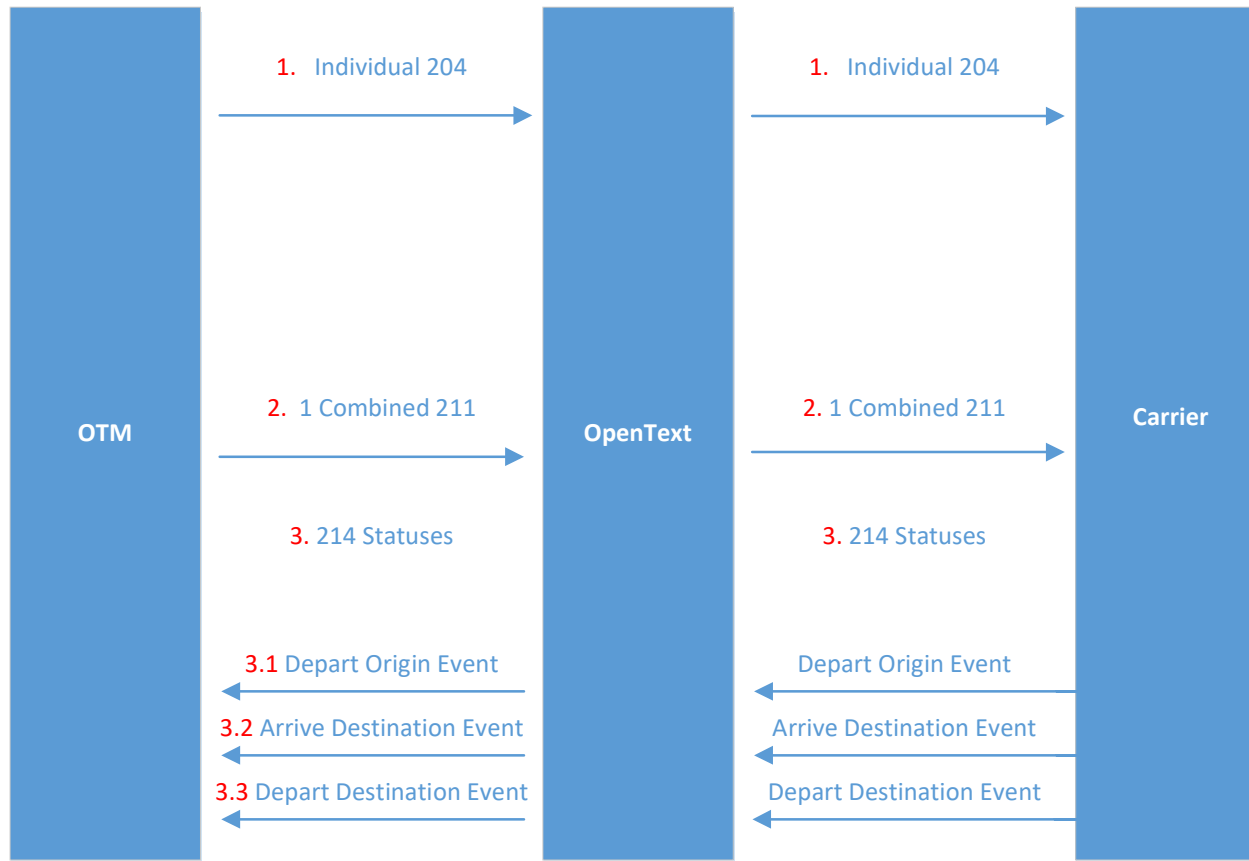

OTM updates 211 and send it to carrier.

EDI 214: Status messages should be sent on EDI 211 shipment. One message per status at Shipment Level to be sent. Associate any move_id as its mandatory field as per the spec.

Status message should be sequential as they occur (Origin events, in transit events and delivery events). This is critical. Location information should match with OTM location information

All date and times should be local times. ETA on status messages always destination local timezone

Store to Store EDI Flow

Numbers in RED indicate the sequence of the messages

EDI 204:

Carmax sends combined Load tender with multiple vehicles (cars). Also load tender may have multiple stops (Pickup and / or delivery). Each stop may have multiple vehicles (cars) associated. Move Id (vehicle), location information should be stored to send on 214 messages.

Carrier SHOULD NOT send EDI 211 (as opposed to Auction to Store scenario). This can be identified based on Move type (OTHER_TO_STORE for Auction to Store, STORE_TO_STORE for Store to Store) received on EDI 204 message.

EDI 211 from OTM to Carrier:

OTM sends 211 and send it to carrier.

EDI 214: Status messages should be sent on EDI 211 shipment. One message per status at Shipment Level to be sent.

Status message should be sequential as they occur (Origin events, in transit events and delivery events). This is critical. Location information should match with OTM location information

All date and times should be local times. ETA on status messages always destination local timezone
